

August 2026 University Hill Noise Report

A report of The Quiet Enjoyment Project, University Hill, Boulder

Report #2 in a series. Report #1 (October 2025) available on request. Every number below comes from Boulder Police Department dispatch records or the City of Boulder open-data portal and can be independently reproduced; analysis code available on request. Questions and corrections: stephanvdm@gmail.com.

What happened after the October 2025 report

The October 2025 report documented three years of escalating noise from Boulder Police dispatch records: complaints up 21% in two years, 37% of the problem driven by 24 addresses, and chronic offenders undeterred. City Council and BPD received it. BPD responded: the Hill Neighborhood Impact Team under Sgt. Michael Marquez was expanded from four officers to five, weekend overtime patrols were funded, and officers were directed to enforce more aggressively. In March 2026, Sgt. Marquez told this report's author that he has directed officers to "shift from education to enforcement" and "to be proactive on tickets that have probable cause, meaning audible from 100' after 11pm and audible from 200' before 11pm" — and PIKE received a municipal citation that month. The same update carried a warning sign: citywide staffing shortages have pulled the team around, and its shift now runs Wednesday–Saturday, noon to 10 p.m.^[1]

This update tests whether it worked — using a better data source. The City of Boulder publishes its police calls-for-service on the city open-data portal, updated daily, covering January 2023 to the present, and including two things BPD's records-request extracts never gave us: the time the first officer arrived, and the outcome of every call (warning, summons, gone-on-arrival). This report is built on 9,961 noise complaints citywide from that feed, cross-validated record-by-record against the extract BPD provided for the October report.^[2]

Did it work?

CONCLUSION #1: NO. THE NOISE DID NOT GO DOWN — COMPLAINTS HIT RECORD LEVELS. First-half 2026 complaints from Hill addresses were 353, up 50% from 236 in the first half of 2025 after three flat years. October 2025 (127 complaints) was the worst month ever recorded; April 2026 (101) was the worst April. In the eight months after the November enforcement expansion, complaints ran 39% above the same window a year earlier (427 vs. 307).

University Hill noise complaints per month, Jan 2023 – Jul 2026 (City of Boulder open data)

Could this just be residents reporting more? The data says no. Calls flagged by dispatch as duplicates (multiple neighbors, one party) stayed at 1–2% in both years. The number of Hill blocks generating complaints barely moved (60 to 69), but complaints per active block jumped from 3.9 to 5.1 — the same places, hit harder. Citywide complaints rose 23% over the same period while the Hill rose 50%, pushing the Hill’s share of all Boulder noise complaints to 26%, the highest first-half share on record. More officers were present and more tickets were written (see below) — and the noise still got worse.

Enforcement went up. It is still not enough to deter.

Because the open data records arrivals and outcomes, this report can measure enforcement itself for the first time — the metrics we asked for in October:

University Hill noise calls	H1 2025	H1 2026
Complaints (Jan–Jun)	236	353
An officer arrived on scene	75%	79%
Median response time (call to arrival)	12.9 min	13.9 min
90th-percentile response time	41 min	40 min
Outcome: warning given	71 (30%)	83 (24%)
Outcome: summons (ticket) issued	8 (3.4%)	17 (4.8%)
Outcome: gone on arrival / unable to locate	2	7

Note: “arrived” means an arrival timestamp exists; some arrivals go unlogged, and calls at registered parties are held ~20 minutes by design while dispatch phones the host. Median response beats BPD’s own citywide Priority-3 median of 14:37.

CONCLUSION #2: BPD DID MORE — TICKETS DOUBLED — BUT A TICKET STILL FOLLOWS ONLY 1 CALL IN 21. Response time is not the binding problem: the median Hill noise call gets an officer in about 14 minutes, faster than the citywide routine-call median. The binding problem is what happens next: warnings outnumber tickets five to one, and a fifth of calls never get an officer at all. Warnings do not deter houses that have been warned a dozen times. For comparison, in Fort Collins “unreasonable noise” is a misdemeanor carrying a fine of up to \$1,000 and up to six months, ticketable to every resident of the house; Boulder’s general penalty authority (up to \$2,650 per violation, each day a separate violation, B.R.C. 5-2-4) is barely touched.^[3]

The Fort Collins measuring stick. Fort Collins — the closest comparable college town (CSU, ~34,000 students) — shows what a working regime looks like, and the difference is not ticket volume. Fort Collins

logged about 2,426 dispatched noise and party calls in 2019, roughly 14 per 1,000 residents; Boulder logged 2,942 noise calls in 2024, about 28 per 1,000 — double the rate, and rising. Fort Collins' officers actually cite less often than Boulder's (27 citations against 469 warnings in 2019; roughly 30 “unreasonable noise” citations a year in 2023–24). What differs is the weight behind each one: there, unreasonable noise is a criminal misdemeanor carrying up to \$1,000 and six months, chargeable to every resident of the house, sitting on top of a nuisance-gathering ordinance born of the 2004 CSU riots, a public-nuisance ordinance that reaches owners, and a registration program open to all residents. After that structure went in, Fort Collins' noise and party calls fell 45% in five years and kept drifting down; the city now files house parties under “regulations working effectively” and aims its current noise-code work at car stereos. Deterrence comes from the size and certainty of the consequence and the accountability of the property — not from officer hours alone. Boulder today has the mirror image: double the per-capita complaint volume, penalties that arrive as modest municipal fines when they arrive at all, and owner-accountability machinery that has never been used on the Hill.^[11]

The houses we named went quiet. New houses took their place.

The table ranks Hill addresses by first-half 2026 noise complaints (exact addresses via the city’s rental-property feed), worst first, with each address’s three-year history. Red intensity tracks the H1 2026 count. Below the divider, in green: the top offenders named in Report #1 and what happened to them after publication. RY = report year, Oct 20–Oct 19; H1 2026 = Jan–Jun calendar 2026. ▲ = on pace to exceed last year; ▼ = collapsed.^[2]

Address	RY2023	RY2024	RY2025	H1 2026	Trend
1043 Pleasant St	4	6	13	13	▲
1045 12th St	5	2	7	8	▲
1005 Broadway	1	1	6	7	▲

H1 2026 counts cover licensed rental properties (the city feed with exact addresses); a records request for exact addresses at all properties was submitted in August 2026.

CONCLUSION #3: CONSEQUENCES WORK WHEN APPLIED — AND THE PROBLEM ROTATES TO

WHOEVER ISN'T FACING THEM. Every house named in Report #1's top tier collapsed: 1146 12th St from 21 complaints to 3, 972 14th St from 20 to 2, PIKE (1010 12th St, cited again in March) from 11 to 3. Being named, watched, and ticketed changes behavior. But the table's top half is the other lesson: 1043 Pleasant St matched its entire prior-year total (13) in six months, and houses with no history — 983 14th, 1111 College, 891 12th — erupted while attention was elsewhere. Episodic pressure moves the problem; only standing machinery ends it. Boulder built that machinery in August 2024: under B.R.C. Chapter 10-2.5, a single-family parcel with five or more cited public nuisances in twelve months (counted Aug. 1–Jul. 31) is a "chronic nuisance property" — noise violations carry a rebuttable presumption — triggering a mandatory abatement plan and, for rentals, license consequences up to revocation (B.R.C. 10-3-16). To our knowledge, no Hill house has yet been designated. 1043 Pleasant St is the test case this fall.^[5]

A property to watch: 891 12th St. This is the former Marpa House — the 1923 fraternity house held by the Shambhala community from 1977 until its \$4.9 million sale in 2019 — whose conversion into a 48-bed student apartment building ("Ash House," since rebranded 891 Exchange) was approved in 2021 over sustained neighborhood opposition, and only with conditions stricter than any other rental on the Hill: quiet hours from 8 p.m. to 8 a.m. daily (a Council addition explicitly tighter than the citywide code), 24/7 on-site management, a one-person-per-bedroom occupancy cap, a good-neighbor agreement, a single designated address for code-enforcement complaints, and ten years of annual city compliance reviews. Its record since: the city ordered the building closed in September 2024 after finding fifteen unpermitted bedrooms and life-safety violations (litigation settled with the bedrooms removed), and management changed hands in February 2025. Here is what the noise data shows: zero noise complaints at this address from its 2023 opening through April 2026 — then seven calls in ten weeks beginning May 11, 2026 (five within the first half), including two calls after 2 a.m. on the same June night, both closed with warnings rather than citations. At this address, a late-night party is not just a citywide noise violation; it is a violation of the quiet-hours condition its land-use approval depends on, and the annual compliance review exists precisely to catch it. No property on the Hill has a shorter path from noise complaints to consequences. We ask Planning & Development Services to put this complaint record before the building's next annual review, and we ask the new manager to demonstrate the on-site management its approval requires.^[10]

The open-air clubs: a point for City Council

County ownership records put an institutional face on the top of the table. Six of the sixteen highest-complaint properties of H1 2026 are fraternity houses held by fraternal building associations or national housing entities: Sigma Nu's association LLC at 1043 Pleasant St (13 complaints in six months — the worst on the Hill), SigEp's national housing company at 1005 Broadway, Phi Kappa Tau at 1150 College Ave, Chi Psi's house corporation at 1080 14th St, the Beta building association at 911 17th St, and Kappa Sigma's building association at 1100 Pennsylvania Ave. Across the full 95-property watch list, ten properties are Greek-owned. The same records expose repeat landlords: a single LLC owns three listed properties (1012 14th, 1080 13th, and 1114 12th St), a matching pair of LLCs owns 1146 and 1122 12th St, and Acacia's house corporation owns two.^[12]

These are not roommates whose party got away from them. They are institutionally owned venues — most carry tax-exempt fraternal accounts with the county — operating in practice as open-air clubs in a residential zone: recurring amplified events, crowd traffic, and a business’s indifference to a warning. That institutional structure is also their weakness, because a club has what a houseful of undergraduates does not: an owner with insurance, a national office, a recognition agreement with the university, and a rental license. One wrinkle of state law makes city enforcement decisive here: Colorado’s Noise Abatement Act contains an exemption for nonprofit entities using their own property for entertainment events — untested for fraternity parties, but a door only a court could close — while Boulder’s ordinances contain no such exemption and are expressly preserved by the state statute. If Council wants the open-air clubs brought inside the law, city code is the tool, and it is Council’s tool to direct.

The tools are on the books. They are not being used.

Half of everything happens in fifteen hours a week: 49% of all Hill noise complaints land Thursday–Saturday between 9 p.m. and 2 a.m. — 9% of the week. 53% fall inside the ordinance’s nighttime window (11 p.m.–7 a.m., 50 dB(A) limit), when residents are trying to sleep.

The evidence myth. Hill residents have repeatedly been told that only a police-calibrated meter can prove a violation, and that video of a flagrantly loud party is not evidence. Boulder’s own code says otherwise. Since September 2022 (Ordinance 8531, adopted 8–1 as an emergency measure), amplified sound audible 100+ feet beyond the property line at night — or 200+ feet during the day — is a violation with no meter and no complainant required; the Deputy City Attorney told Council an officer "will be able to just pace off the 200 feet." The decibel section (5-9-3) requires an ANSI Type I/II meter but nowhere says a police officer must operate it — the code itself makes the manufacturer’s spec sheet *prima facie* proof that a meter (including a resident’s Class 2 unit, the successor category) qualifies. Video authenticated by the person who shot it is ordinary evidence in Colorado courts, and it is near-direct proof for the audibility offenses — and for who was present, which matters because every resident present is legally responsible for amplified sound from the premises (5-9-6(a)(3)). Distance-audibility standards like Boulder’s have survived legal challenge across the country.^[6]

The patrol gap. These authorities compound: an officer who drives past a party and hears it from 100 or 200 feet out can shut it down and cite it on the spot — no resident call, no meter, no complaint form — and can declare a nuisance party and order dispersal on personal observation (B.R.C. 5-3-11(d)). Sgt. Marquez has asked his officers for exactly this proactivity, and the March PIKE citation shows it working. But it currently rests on one sergeant’s briefings, and the Hill team’s shift now ends at 10 p.m. — the hour the complaint curve takes off. Proactive patrol during fifteen predictable hours a week is the highest-yield, lowest-cost enforcement available to the city.

CONCLUSION #4: BPD CAN LAWFULLY DRIVE THE HILL AND SHUT DOWN EVERY AUDIBLE PARTY — NO CALL, NO METER, NO COMPLAINANT. IT NEEDS TO BE POLICY, STAFFED TO THE HOURS THE PARTIES KEEP.

Council eliminated the complaint requirement four years ago, specifically so officers would not need decibel meters or complaint forms. What remains is to make proactive patrol standing departmental policy rather than sergeant-by-sergeant discretion, and to schedule the Hill team through the Thursday–Saturday 9 p.m.–2 a.m. peak its own dispatch data identifies.

Boulder’s noise limits are health standards, not taste standards

Boulder’s residential limits — 55 dB(A) daytime, 50 dB(A) night (B.R.C. 5-9-3) — are not arbitrary. They descend directly from the U.S. EPA’s 1974 determination, under the Noise Control Act, of the outdoor level "requisite to protect the public health and welfare with an adequate margin of safety" (55 dB), spread to city codes through EPA’s model ordinance. The World Health Organization’s community-noise guidelines identify the same 55 dB as the threshold of serious annoyance and 50 dB as moderate annoyance. In other words: the limits ARE the health line. Sound above them is, by the issuing agencies’ own definitions, a public-health exposure. And at night there is no margin at all: WHO’s health-based night guideline is 40 dB — ten decibels below Boulder’s night limit — and WHO’s evidence review places the thresholds for hypertension and myocardial infarction at 50 dB, exactly where Boulder’s night limit begins. WHO describes night levels above 55 dB as "increasingly dangerous for public health."^[7]

What the medical literature documents above these levels:

- **Heart disease.** The WHO evidence review rates it high-quality evidence that ischemic heart disease risk rises about 8% per 10 dB of chronic noise exposure; hypertension, stroke, and diabetes show similar gradients. The mechanism (stress hormones, vascular oxidative stress) operates during sleep whether or not the sleeper wakes.
- **Sleep.** Physiological sleep disruption — arousals, fragmentation, cardiovascular activation — begins at single-event levels as low as 33 dB at the pillow. A party measured at 60+ dB at a neighbor’s bedroom window is orders of magnitude past that.
- **Children.** A 5 dB increase in chronic noise exposure was associated with a two-month delay in reading age in the largest European study of noise and child cognition. University Hill’s permanent residents include young families.
- **Bass.** A-weighted meters under-count low-frequency sound: at equal dB(A), bass-heavy amplified music is roughly 3–6 dB more intrusive than broadband noise, and WHO recommends lower limits when low-frequency content dominates. A reading that "complies" during an EDM set understates the exposure — a fact CU implicitly conceded when it adopted third-party perimeter monitoring and a live decibel cap for 2026 Folsom Field concerts after the October 2025 John Summit show.^[8]

CONCLUSION #5: EVERY COMPLAINT IN THIS REPORT IS A DOCUMENTED HEALTH EXPOSURE, NOT A LIFESTYLE DISAGREEMENT.

More than half of Hill complaints occur in the sleeping hours. The people absorbing that exposure include children, night-shift workers, the ill, and the elderly. When enforcement fails, the cost is not comfort; it is measured in blood pressure, sleep architecture, and reading age.

What we are asking for

City Council:

- Direct BPD — as standing policy, not sergeant-by-sergeant discretion — to run proactive noise patrols on the Hill: drive the neighborhood Thursday–Saturday, 9 p.m.–2 a.m., disperse nuisance parties on

officer observation (B.R.C. 5-3-11(d)), and cite on the 100/200-foot audibility standard (5-9-6). Everything in that sentence is already law.

- Fund the Hill Neighborhood Impact Team as permanent line-item staffing whose shift covers the peak: its current schedule ends at 10 p.m., the hour the complaint curve takes off.
- Direct BPD to publish a quarterly noise-enforcement scorecard: complaints, median and 90th-percentile response time, % of calls with no officer arrival, warnings vs. summonses, and officer-initiated (no-complainant) citations. The city's open-data feed proves this costs almost nothing.
- Set an enforcement policy, not a suggestion: second verified complaint at the same address within 12 months results in a citation, not another warning (the model of Ann Arbor's escalating fine ladder and San Luis Obispo's 9-month no-warning list, after which SLO's complaints fell 25–35%).
- Treat the fraternity venues as the clubs they operate as: direct staff to apply the amplified-sound and nuisance-party ordinances (5-9-6, 5-3-11) to the six Greek-owned properties in this report's top sixteen, open chronic-nuisance review as cited violations accumulate, and formally refer each chronic house to CU and to its national organization. City code contains no nonprofit exemption; this is squarely within the city's power.

Boulder Police Department:

- Patrol proactively, as Sgt. Marquez has already directed: an officer who hears amplified sound 100 feet out at night (200 by day) needs no call, no meter, and no complainant to shut the party down and cite it (B.R.C. 5-9-6; 5-3-11(d)). Make it departmental policy, report the results, and schedule the Hill team through the 9 p.m.–2 a.m. peak.
- Treat resident Class 2 meter readings and authenticated video as the corroborating evidence the code and Colorado evidence rules already permit.
- Cite, don't warn, at repeat addresses. Warnings at a house with double-digit complaints are not enforcement; they are scheduling.

City Attorney:

- Open chronic-nuisance review (B.R.C. 10-2.5) of every Hill address reaching five cited violations in the Aug. 1–Jul. 31 nuisance year, starting with 1043 Pleasant St, and use the abatement-agreement and rental-license levers written for exactly this fact pattern.
- Publish the number of noise citations prosecuted and their outcomes, so the neighborhood can see whether tickets survive court.

University of Colorado:

- Route every off-campus noise citation into the student conduct process systematically, as the University of Arizona does by pulling citation records from Tucson police, and as Miami University does in Oxford, Ohio.
- Fix or suspend the Party Registration System. Fort Collins' version is open to all residents, integrated with dispatch, backed by a \$1,000 misdemeanor, and publishes its outcomes (97.5% of registered parties citation-free). Boulder's is students-only, opaque, and — as documented in Report #1 — misunderstood even by the officials who run it. A spring-semester suspension paired with proactive enforcement would test, with data, whether it helps the neighborhood or shields violators.

Property owners:

- The owners of the addresses in the table above are on notice, by this report, of what their tenants are doing. Tucson, Tempe, and San Luis Obispo all hold owners financially liable for repeat party-house violations; Boulder's chronic-nuisance chapter can reach rental licenses. Screening tenants is cheaper than losing the license.

Methodology and data notes

Zone. The "University Hill noise impact zone" is unchanged from Report #1: the 2,049 addresses returned by the polygon below on the Boulder County Assessor's database.

Sources. (1) BPD records-request extract of dispatch calls, problem type "NOISEB-Noise Complaint," 10/21/2022–10/19/2025, exact addresses (basis of Report #1). (2) City of Boulder open-data "Boulder PD Calls For Service" feed, Jan 2023–present, refreshed daily: 9,961 noise complaints citywide including first-unit arrival time and disposition, with addresses masked to the hundred block. (3) City open-data rental-property calls feed: exact addresses at licensed rentals, rolling 365 days. All three are cross-checked: 7,868 incidents join one-to-one between (1) and (2) on incident number.

Hill classification in the open data is by hundred block (e.g., "11XX 12th St"). Validated against the exact-address ground truth on the joined records, the block method captures 99.9% of true Hill complaints and runs 11–21% high from blocks that straddle the zone boundary; the bias is stable across years, so every year-over-year comparison here uses the block method on both sides. The H1 2026 increase survives the most conservative correction (+37% at minimum vs. H1 2025).

Complaint counts measure calls, not decibels. Dispatch-flagged duplicate calls were 0.8% (H1 2025) and 1.7% (H1 2026) of Hill volume. Calls at registered parties are held ~20 minutes before dispatch by program design and are not separately identifiable in the data — response-time figures include them. Arrival timestamps are missing on roughly a fifth of calls; some are unlogged arrivals, some are calls no officer reached. Both caveats are flagged where relevant.

Erratum to Report #1: in its 2025 top-24 table, the entry "1005 12th" (6 complaints) should have read 1005 Broadway; 1005 12th St had 1 complaint in that period. No conclusion was affected.
